

Vibe Spot Capstone 1 Product Scope

AI-Powered Place Discovery and Collaborative Recommendation Platform for Pasig City

Vision

Capstone 1 introduces the core Vibe Spot experience: helping users discover places around Pasig City through AI-powered recommendations and enabling them to immediately collaborate with friends through shared discussions.

The focus is not merely finding places. The focus is helping groups decide where to go.

A user should be able to discover a café, share it with friends, discuss options, create a poll, and collectively decide on a destination without leaving the platform.

Landing Page

The user arrives at Vibe Spot and is greeted by a modern, visually engaging landing page.

At the center of the page is the hero headline:

Find Your Weekend Plans

The final phrase changes dynamically every few seconds.

Examples include:

- Weekend Plans
- Coffee Spot
- Study Place
- Date Night
- Food Adventure
- Barkada Hangout

Below the headline is a short description:

Discover hidden gems and authentic local spots across Pasig City, curated by AI based on your preferences and ready to share with your friends.

A prominent "Find a Spot" button serves as the primary call-to-action.

When clicked, the interface smoothly transitions into the AI recommendation experience.

AI Preference Collection

The recommendation process is designed as a focused, conversational experience.

The screen becomes distraction-free, allowing users to concentrate solely on describing what they want.

A collapsible sidebar remains available but minimized.

Activity Preference

The AI asks:

What are you in the mood for today?

Users can freely type their preferences.

Examples displayed through animated placeholder text include:

- Coffee shops in Kapitolyo
- Affordable date spots
- Quiet study cafés
- Places with good WiFi
- Family-friendly restaurants

Below the input field are suggestion chips that users can quickly select.

Examples:

- Coffee Shops
 - Study Spots
 - Date Night
 - Food Trip
 - Parks
 - Coworking Spaces
-

Budget Preference

The AI asks:

What's your budget range?

Selectable options:

- Under ₱200
 - ₱200–₱500
 - ₱500–₱1,000
 - ₱1,000+
-

Group Size

The AI asks:

Who are you going with?

Options include:

- Solo
- Couple
- Small Group (3–6)
- Large Group (7+)

This allows recommendations to better match the social setting.

Search Scope

The AI asks:

Where should we search?

Users can choose:

Near Me

The system requests location access.

A radius slider becomes available.

Users can select a search range from 200 meters up to 7.5 kilometers.

Anywhere in Pasig

Recommendations are generated from across the city.

Generate Recommendations

After completing the preference flow, users press:

Generate Recommendations

The AI begins processing.

AI Recommendation Loading Experience

Rather than displaying a traditional loading screen, Vibe Spot presents an animated AI thinking experience.

Messages rotate on screen:

- Exploring Pasig...
- Finding hidden gems...
- Matching your vibe...
- Comparing locations...
- Preparing recommendations...

The goal is to make recommendation generation feel intelligent and personalized.

Recommendation Showcase

Once recommendations are generated, the interface transforms into a split-screen layout.

The left side displays detailed recommendation information.

The right side displays an interactive map.

The recommendation experience resembles a guided showcase rather than a simple search results page.

Recommendation Presentation

Each recommendation contains:

Photo Gallery

Multiple images showcasing the location.

Place Name

Displayed prominently.

Category Badge

Examples:

- Café
- Restaurant
- Dessert Shop
- Park
- Coworking Space

AI Description

A concise explanation of why the location was recommended.

Example:

This cozy café is ideal for students and remote workers due to its reliable WiFi, comfortable seating, and affordable menu.

Quick Information

- Address
- Contact Number
- Price Range

Tags

Examples:

- Quiet
- Student Friendly
- Good WiFi
- Outdoor Seating
- Pet Friendly

Operating Hours

Opening and closing times.

Actions

- Save
- Share
- View Reviews

AI Showcase Animation

Instead of instantly showing all recommendations, the AI presents them one by one.

The information panel updates.

The map smoothly transitions to the highlighted location.

Animations create the feeling that the AI is personally introducing places.

The showcase continues until all recommendations have been presented.

A Skip button allows users to jump directly to the final results.

Recommendation Navigation

After the showcase finishes, users can freely browse recommendations.

Navigation controls include:

- Previous Recommendation
- Next Recommendation

Changing recommendations automatically updates both the information panel and the map focus.

Interactive Map

The map occupies the right side of the recommendation screen.

All recommended places are displayed as pins.

The active recommendation is highlighted.

Users can:

- Zoom
- Pan
- Explore surrounding areas
- View nearby landmarks

A fullscreen mode allows deeper exploration of the map.

Additional Recommendations

A button labeled:

Explore More Recommendations

opens a panel containing supplementary recommendations.

Each card displays:

- Image
- Name
- Category
- Short Description

Selecting a card promotes it into the primary recommendation showcase.

User Accounts

Users can:

- Register
- Log In
- Log Out

Authentication enables personalized experiences.

Saved Places

Every recommendation can be bookmarked.

Saved places are stored within the user's account.

Users can revisit them later through the sidebar.

Recommendation History

Previous recommendation sessions are automatically saved.

Examples:

- Study Cafés in Kapitolyo
- Affordable Date Spots

- Weekend Food Trip

AI-generated session titles help users easily identify past searches.

Group Chats (Collaborative MVP)

Collaboration is introduced through a lightweight but functional group chat system.

The goal is to bridge discovery and group decision-making.

Group Creation

Users can create planning groups.

Examples:

- Saturday Coffee Run
- Study Group
- Date Night Plans
- Food Trip Squad

Creating a group requires:

- Group Name
 - At least one additional member
-

Group Chat Interface

On desktop, the page consists of:

Left Side

List of group conversations.

Right Side

Active chat window.

On mobile devices, the interface transitions between the conversation list and chat view.

Real-Time Messaging

Members can exchange messages instantly.

Messages appear in real time, allowing groups to discuss recommendations as they browse.

Sharing Recommendations

Every recommendation includes a Share button.

Clicking the button opens a modal.

The user selects a group chat.

The recommendation is sent into the conversation as a rich card.

Shared Place Card

The card displays:

- Place Image
- Place Name
- Category
- Brief Description

Selecting the card opens the complete recommendation view.

This allows recommendations to move seamlessly from discovery into discussion.

Shared Places Collection

Each group contains a dedicated section called:

Shared Places

Every location shared within the conversation is automatically collected here.

This becomes the group's collaborative shortlist.

Members can quickly review all discussed locations without scrolling through messages.

Poll System

Groups can create polls to help make decisions.

Examples include:

Which café should we visit?

What time should we meet?

Polls contain multiple options and allow members to vote.

Results update in real time.

This feature addresses one of the most common planning challenges: reaching a decision.

Basic AI Chat Assistant

Inside group chats, users can access a lightweight AI assistant.

The assistant can answer questions such as:

Recommend another café nearby.

Suggest a cheaper alternative.

Find a place with better parking.

Responses appear directly in the conversation.

The assistant serves as an extension of the recommendation engine within collaborative discussions.

Capstone 1 Outcome

At the conclusion of Capstone 1, users can:

- Discover places through AI recommendations
- Explore locations on an interactive map
- Save recommendations
- Revisit previous recommendation sessions
- Create group chats
- Share recommendations with friends
- Maintain a shared list of candidate locations
- Create polls
- Ask AI for additional suggestions within conversations

The platform successfully demonstrates both AI-powered discovery and collaborative decision-making. Capstone 1 answers, “**Where should we go?**”
